Therefore, at 220V, you get a maximum output of 200 amps to tackle more serious projects. In addition, a 60% duty cycle allows you to weld longer before taking a break. Besides low weight, IGBT inverter technology with MCU chips provides consistent arc results.

So we will have 380VDC and 18VDC. Then we use two voltage regulators to get stable 15VDC and 5VDC. We add two huge high voltage capacitors to store the 380VDC and use it later with the final block, the IGBT Bridge. The driver will apply SPWM signals to this IGBT bridge and create sine wave signal of high voltage. That's how the inverter works.
