Supercapattery can be achieved by many combinations of electrodes and electrolytes that ultimately mean to achieve the qualities of a supercapacitor (high specific power) and a battery (high specific energy) at the same time [23]. It is also necessary to think about sustainability, renewability, and "green chemistry" when picking materials ...

Compared to batteries, supercapacitors have low internal resistance or ESR, thus enabling high power density. Leakage current occurs over time when a supercapacitor is held at a rated voltage. It results from naturally occurring imperfections in the supercapacitor's electrode material. Leakage current is a function of voltage and temperature.
