

Lithuania outdoor power brand new field

Will Lithuania switch from fossil fuels to electricity?

Lithuania would switch from fossil fuels to electricity from renewable energy sources (RES), generate electricity for domestic needs, to produce hydrogen, and export not only energy, but also higher-value sustainable products.

Should Lithuania produce electricity by 2030?

By 2030, Lithuania should not only produce electricity for domestic use, but also create the conditions for the development of a hydrogen industry and the export of residual energy.

How will Lithuania's energy situation change in 2050?

Currently, Lithuania is dependent on imports of natural gas, oil and electricity, but by 2050 the situation will have changed dramatically, with fossil fuels being phased out in favour of electricity from renewable energy sources, biogas and hydrogen.

Will Lithuania become a hub of next-generation industrial development?

The Energy Vision 2050 presents scenarios that open up opportunities for Lithuania to become the hub of next-generation industrial development and a climate-neutral country.

What will happen if electricity generation peaks in Lithuania?

Peaks in electricity generation will lead to the power-to-gas production of cheap green hydrogen and synthetic fuels. By 2030, 1.3 GW of hydrogen production capacity from electricity generation facilities is planned to be built in Lithuania, and by 2050 the total hydrogen production capacity will reach 8.5 GW.

How much electricity does Lithuania use per year?

Lithuania currently consumes about 11 terawatt hours (TWh) of electricity per year, and by 2050 to reach carbon-neutrality this demand could reach 74 TWh per year.
