Why is the integrated photovoltaic-energy storage-charging station underdeveloped?

The coupled photovoltaic-energy storage-charging station (PV-ES-CS) is an important approach of promoting the transition from fossil energy consumption to low-carbon energy use. However, the integrated charging station is underdeveloped. One of the key reasons for this is that there lacks the evaluation of its economic and environmental benefits.

What is the capacity optimization model of integrated photovoltaic-energy storage-charging station?

The capacity optimization model of the integrated photovoltaic-energy storage-charging station was built. The case study bases on the data of 21 charging stations in Beijing. The construction of the integrated charging station shows the maximum economic and environment benefit in hospital and minimum in residential.

What is the optimal number of charging piles for PV-es-cs near hospitals?

When the number of EVs increases by 300 %, the optimal number of charging piles for the PV-ES-CS near hospitals increases significantly from 5 to 40. However, the optimal number of charging piles for the PV-ES-CS near office buildings does not increase from 5.

What are the economic and environmental benefits of integrated charging stations?

The economic and environmental benefits of the integrated charging station also markedly differ on different scales: with scale expansion, the rate of return on investment and the carbon dioxide emissions reduction first increase and then decrease.

How much money does Shan et al invest in a power station?

Shan et al. invested about 1.8 million yuan to transform a service area into an integrated power station; in their design plan, the charging equipment is charged 10 times daily at 20 kWh per charge. Given that the profit is 0.8 yuan/kWh and about 58,400 yuan/year, it is expected to pay back in 4.5 years. Table 1.
